

# MSP430 BSL Programmer FCD-PRG01

---

## Highlights

- Supports all MSP430 device families supported by TI example "Bootstrap Loader Hardware" in [SLAU319](#)<sup>1</sup>
- Standard 6 pin, 0.1" header interface
- USB bus powered
- 3.3V target supply output (up to 400mA)
- Cross platform driver support for Windows, Linux, and Mac OS
- Full [Python MSP430 Tools](#) support
- Full [TinyOS](#) support
- Fully Open-Source hardware design<sup>2</sup>

## Product Description

The [FCD-PRG01](#) is a USB bootstrap loader<sup>3</sup> (BSL) programmer for the Texas Instruments MSP430 microcontroller. For designs where low cost or small form factor prohibit the integration of custom programming logic or a large JTAG header, the [FCD-PRG01](#) enables in-system programming by including a single 6 pin header in the target device design.

Originally designed to work with the cross platform [TinyOS](#) toolchain, the [FCD-PRG01](#) provides an open source, cross platform alternative to platform dependent development tools for the MSP430 microcontroller.

The [FCD-PRG01](#) integrates a USB-to-serial converter and on board regulated power supply into a small USB dongle, allowing programming and test capability over a single interface. It exposes a standard 6 pin, 0.1" header which can be used to interface to the target board via a device specific cable harness. This modular approach provides designers with the flexibility to select the optimal physical programming interface for the unique design constraints of each target platform.

## Ordering Information

- FCD-PRG01** MSP430 BSL Programmer  
**FCD-CBL01** Programming interface cable (6x1, 0.1" ↔ 3x2, 2mm)

<sup>1</sup> [FCD-PRG01](#) does not include inverting buffers as shown in the TI reference hardware. Requires PC software to support specific MSP430 device families. Not all MSP430 devices have been tested for hardware compatibility. See page 5 for device family support.

<sup>2</sup> Design files available at <http://www.flyingcampdesign.com/msp430-bsl-programmer.html>

<sup>3</sup> "MSP430 Programming Via the Bootstrap Loader (SLAU319)" Application Note (<http://www.ti.com/lit/pdf/SLAU319>)

## Programming Interface

The [FCD-PRG01](#) provides a standard 6x1, 0.1" programming header for powering and communicating with the target device.

Figure 1: 6x1, 0.1" Header

## Pinout

FCD-PRG01 Signal	FCD-PRG01 Pin	MSP430 devices with TEST pin	MSP430 devices without TEST pin
DTR	1	TEST	TCK
RXD	2	UART_TX	UART_TX
TXD	3	UART_RX	UART_RX
VCC	4	VDD	VDD
RTS	5	RST	RST
GND	6	GND	GND

## Electrical Characteristics

### VCC Target Supply Output (Pin 4)

Parameter	Minimum	Typical	Maximum	Units	Conditions
Output Voltage	-	3.3	-	V	Vout = 0 V Iout = 400 mA
Output Current	-	-	0.4	A	
Short Circuit Current	-	450	-	mA	
Dropout Voltage	-	75	200	mV	
Accuracy	-	1	-	%	

### UART and I/O (Pins 1,2,3,5)

Parameter	Minimum	Typical	Maximum	Units	Conditions
DC Input Voltage	-0.5	-	3.8	V	Isource = 3 mA Isink = 8 mA
Output Drive Strength	-	12	-	mA	
Output Voltage High	2.2	2.8	3.2	V	
Output Voltage Low	0.3	0.4	0.6	V	
Input Switching Threshold	1.0	1.2	1.5	V	
Input Switching Hysteresis	20	25	30	mV	

## Programming Cables

### FCD-CBL01

A programming cable harness which mates with standard 3x2, 2mm PCB headers is available from Flying Camp Design for use with the [FCD-PRG01](#). Pinout for this cable is available in schematic form at [FCD-CBL01](#).

Figure 2: FLYING CAMP DESIGN FCD-CBL01

Flying Camp Design recommends using the following through hole and surface mount headers for use with the [FCD-CBL01](#):

Figure 3: Recommended headers for use with the FCD-CBL01 cable

A Cadsoft Eagle CAD library which contains land pattern footprints for these headers is available for download on the [FCD-PRG01](#) product page: <http://www.flyingcampdesign.com/msp430-bsl-programmer.html>

### Custom Programming Cables

For those customers wishing to design their own custom programming cables, Flying Camp Design recommends the following mating connector for use with the 6 pin BSL programming interface:

Figure 4: [Molex 50-57-9006](#)

## Installation

The **FCD-PRG01** uses a USB ↔ Serial interface chip (**FTDI Chip FT232R**) and corresponding operating system driver to provide a Virtual COM Port (VCP) interface layer to the BSL programming software. The BSL programming software depends upon this VCP interface layer to control the communication pins on the programmer.

1. **Before plugging in the **FCD-PRG01** to your computer**, install the appropriate driver for your operating system by following the corresponding installation guide available online at:  
<http://ftdichip.com/Documents/InstallGuides.htm>

A full listing of the latest VCP drivers for all supported operating systems is available online at:  
<http://ftdichip.com/Drivers/VCP.htm>

**Note:** A Linux driver for the FT232R is included in most newer kernels ( > 2.4.20 or greater). However, on some kernels an older F232BM driver may be used which is compatible with the FT232R.

2. After installing the appropriate driver for your operating system, insert the **FCD-PRG01** into a free USB port on your computer.
3. If installation was successful, the **FCD-PRG01** should appear as a VCP on your computer:

<b>Windows</b>	COM[X]
<b>Linux</b>	/dev/ttyUSB[X]
<b>Mac OS X</b>	/dev/tty.usbserial- [...]

## MSP430 Device Family Support

Any MSP430 device family that is supported by the example hardware described in [SLAU319](#) section 4.1 "Hardware Description" should also be compatible with the [FCD-PRG01](#). The following table provides information about MSP430 device families that may not be compatible with the [FCD-PRG01](#) hardware.

Device Family	Summary
MSP430F543xA	<a href="#">FCD-PRG01</a> is incompatible with MSP430F543xA pre-Rev H silicon devices. There is a bug in MSP430F543xA pre-Rev H devices which requires that the second low pulse on TEST must be shorter than 15us, which the VCP drivers for the <a href="#">FCD-PRG01</a> are unable to achieve. Please reference SYS10 in <a href="http://www.ti.com/lit/pdf/slaz290">http://www.ti.com/lit/pdf/slaz290</a> for more details. TI has confirmed that this bug has been fixed in Rev H silicon and later.

## Software Support

The Virtual COM Port (VCP) drivers provide a serial port interface to the BSL control software. This generic software interface enables the use of third party BSL tools, as well as provides a simple abstraction to those users wishing to write their own BSL tools. The mapping between the VCP signal and the programmer pins is shown in the table on page 2. The following examples show how to use the [FCD-PRG01](#) with the BSL tools available from TI and a couple popular MSP430 toolchains.

### TinyOS

The TinyOS toolchain includes built in support for the [FCD-PRG01](#). The following example can be used to compile a TinyOS application and install it onto an MSP430 based TinyOS “platform”:

```
make [platform] install miniprogram
```

More information about the TinyOS toolchain is available online at: [TinyOS](#)

### SLAU319

The TI support files<sup>4</sup> for [SLAU319](#) include a command line demo utility for communication with 1/2/4xx BSLs. This utility is called “BSLDEMO2.exe” and is designed to work with the example hardware described in [SLAU319](#) section 4.1 “Hardware Description”. The [FCD-PRG01](#) mimics this hardware by providing a VCP interface to the BSL control software. However, the [FCD-PRG01](#) does not include inverting buffers on RST and TCK as shown in the TI reference hardware. Furthermore, the [FCD-CBL01](#) swaps the RST and TCK pins (with respect to the virtual COM port RTS and DTR pins). Therefore, the BSLDEMO2.exe utility source code provided by TI must be patched and recompiled to work correctly with the [FCD-PRG01](#) + [FCD-CBL01](#) combination. A patched version of BSLDEMO2.exe can be downloaded from <http://www.flyingcampdesign.com/msp430-bsl-programmer.html> while the patched source code can be obtained from <https://github.com/FlyingCampDesign>. The following example programs the target with the TI-TXT firmware file “firmware.txt”:

```
BSLDEMO2.exe -s2 -cCOMx firmware.txt
```

### Python MSP430 Tools

The [Python MSP430 Tools](#) project includes built in support for the [FCD-PRG01](#). The Python MSP430 Tools can be installed from <http://pypi.python.org/pypi/python-msp430-tools/> via “pip” by running:

```
pip install pyserial python-msp430-tools
```

The following example clears all flash memory, programs the target with the Intel HEX firmware file “firmware.hex”, and then resets the target:

```
msp430-bsl-fcdprog.py -p /dev/path-to-msp430-bsl-programmer -r -e path/to/firmware.hex
```

### MSP430 BSL Utility (no longer under active development)

The Flying Camp Design MSP430 BSL Utility is an open source GUI utility which was designed to be fully compatible with the [FCD-PRG01](#). Open source code can be obtained from: <https://github.com/FlyingCampDesign>  
More information about using the [FCD-PRG01](#) with this software is available on the MSP430 BSL Utility product page: <http://www.flyingcampdesign.com/msp430-bsl-utility.html>
